School of Computing and Creative Technologies

Assessment Brief

Submission details

Module title:	Distributed and Enterprise Software Development
Module code:	UFCFTR-30-3
Module Leader:	Khoa Phung, Dilshan Jayatilake
Assessment title:	Task 1
Year:	2026-27
Assessment type:	Group Project and In-class Demonstration
Assessment weighting:	40% of total module mark
Size or length of assessment:	
Module learning outcomes assessed by this task:	1. MO1. Describe and evaluate the concepts and paradigms of modern enterprise systems with particular focus on architectures, components, interfaces and services. 2. MO2. Evaluate the legal, ethical, social and professional implications in development life-cycle of large-scale software systems.
Use of AI in assessment:	Please refer to the UWE categorisation guidance for using Generative AI in assessments.
Guidance on Referencing (inc AI):	Students should be able to identify and discuss relevant sources, legislation, professional standards and other evidence used to inform modelling and design decisions during the demonstrations and Q&A. Use UWE Harvard referencing where references are included within submitted artefacts. Referencing - Study skills | UWE Bristol Using generative AI at UWE Bristol - Study skills | UWE Bristol

Submission and feedback dates

Submission deadline:	Before 14:00 on 10th December 2026 Not eligible for 48-hour late submission window All times are 24-hour clock, current local time (at time of submission) in the UK.
Submission format:	All assessed artefacts and development evidence must be maintained and submitted through the group's version-control repository (GitHub or GitLab). The repository must contain the final artefacts and a clear development history. Assessment also includes scheduled live in-class sprint reviews/demonstrations.
Marks and Feedback due on:	Within 20 days after the final presentation
Marks and Feedback will be provided via:	Formative feedback will be provided during weekly practical sessions (Stand-ups) and sprint reviews. Summative feedback will be provided following the assessed sprint reviews and final in-class demonstration.

Completing your assessment

This is a group-based practical assessment based on the case study provided by the module team. Students will work in groups of **4-5 members**. The group formed for Assessment Task 1 will remain together for the full duration of the module, including Assessment Task 2.

Task 1 represents the first development phase of the complete module project. The models, processes, services and components developed during Task 1 must be retained, developed further and integrated into the final product developed during Task 2. ***Each group is required to complete ONE of the provided use cases derived from the case study.***

The assessment will run through an agile sprint-based approach. All assessed artefacts must be version controlled and available in the group's GitHub or GitLab repository. The repository history will also provide evidence of development activity and individual contribution.

i* Socio-Technical Modelling

Your group must analyse the case study and develop:

- an i* Strategic Dependency (SD) model
- an i* Strategic Rationale (SR) model

The models should identify and represent, where appropriate:

- actors
- goals and softgoals
- tasks
- resources
- dependencies
- stakeholder expectations
- organisational and socio-technical relationships

The SD and SR models should demonstrate how stakeholder goals, expectations, responsibilities and dependencies influence the requirements and design of the enterprise system. The i* models may be developed progressively from Sprint 1, but they will be summatively evaluated during Sprint 2.

Strategic-Level Business Process Model

Your group must develop a strategic-level BPMN model representing the overall enterprise described by the case study. The model should provide an appropriate high-level abstraction of the organisation.

- major business processes
- major organisational functions and responsibilities
- key actors
- external organisations and services
- interactions between different areas of the enterprise
- relationships between the principal business processes

There should be clear alignment between the strategic process model and the stakeholder goals and dependencies identified through the socio-technical analysis.

Selection of Two Major Functionalities

From the strategic analysis, each group must identify two major business functionalities to be developed in detail. The proposed functionalities must be discussed with and agreed by the module team before detailed implementation begins.
The selected functionalities should be sufficiently substantial to demonstrate an end-to-end business process and provide opportunities for user interaction, automated processing, business decisions, service interaction, data processing, and alternative or exceptional process flows.

End-to-End Operational Business Process Models

For each of the two agreed major functionalities, the group must develop a detailed operational BPMN model representing the complete end-to-end business process.

- pools and lanes
- user tasks
- service tasks
- call activities and sub-processes
- appropriate gateways
- message flows
- events and boundary events
- alternative process paths
- exception paths
- interactions with external systems or services

The operational processes should demonstrate clear traceability to the strategic BPMN and i* models.

Process Automation Using Camunda

The two operational business processes must be implemented as executable business processes using Camunda. Producing BPMN diagrams alone is not sufficient.

- executable BPMN processes
- Camunda user tasks
- Camunda Forms
- service tasks
- automated business logic
- process variables and data handling
- business decisions
- gateways and events
- interactions with users and supporting services
- external service interaction
- appropriate exception and error handling

The group should be able to demonstrate clearly which activities are performed by users and which are automated by the process engine or supporting services.
Relationship between Task 1 and Task 2

Assessment Task 1 and Assessment Task 2 are stages of the same enterprise software development project.
i* SD/SR Models -> Strategic BPMN -> Operational BPMN -> Camunda Process Automation -> Final Enterprise Software Product

The two major functionalities developed and automated during Task 1 must be integrated into the final product developed during Task 2. Groups are expected to refine and extend their Task 1 work as the project progresses.

Sprint-Based Development

Sprint 0 (28th September 2026) - Group Formation and Preparation

Sprint 0 is a non-assessed preparation sprint. Groups should:

- form groups of 4-5 students
- review and analyse the case study
- establish communication channels and regular meeting arrangements
- establish the GitHub or GitLab repository
- select an appropriate project management approach/platform
- identify initial roles and responsibilities
- begin stakeholder analysis
- establish an initial product backlog
- identify candidate major functionalities

Students who have not joined a group by the end of Sprint 0 may be allocated to a group by the module team.

Sprint 1 (12th October 2026) - Strategic Process Analysis and Project Setup

20% of the Task 1 Group Mark
Scheduled weekly stand-ups start from Sprint 1.
Sprint 1 focuses on understanding the enterprise at a strategic level and establishing the project foundation. Groups should demonstrate:

- a strategic BPMN model representing the enterprise
- analysis of major business processes and organisational responsibilities
- identification and scoping of the two candidate major functionalities
- an initial product backlog and sprint plan
- effective use of the GitHub/GitLab repository
- clear evidence of group activity and contribution

The i* models may be started during Sprint 1 as part of the development process, but they are not summatively evaluated in Sprint 1.

Sprint 2 (2nd November 2026) - Socio-Technical and Operational Modelling with Initial Automation

30% of the Task 1 Group Mark
Sprint 2 focuses on connecting stakeholder analysis to detailed operational processes and beginning executable automation. Groups should demonstrate:

- completed i* Strategic Dependency (SD) model
- completed i* Strategic Rationale (SR) model
- two detailed operational BPMN models for the agreed major functionalities
- clear traceability between i*, strategic BPMN and operational BPMN
- initial executable Camunda processes
- Camunda user tasks and Forms

- initial service-task implementation where appropriate
- process variables, gateways and business logic
- continued iterative development evidenced through GitHub/GitLab

Sprint 3 (23rd November 2026) - Final Implementation, Integration and In-Class Demonstration

50% of the Task 1 Group Mark
Sprint 3 focuses on completing, integrating and demonstrating both major functionalities. Groups should demonstrate:

- completed end-to-end execution of both operational processes in Camunda
- effective Camunda Forms and user interaction
- service tasks and automated business logic
- service, interface and process integration
- process variables and data flow
- alternative and exception flows where applicable
- interaction with relevant users, components and external services
- consistency between i*, strategic BPMN, operational BPMN and implementation
- readiness of Task 1 components for integration into Task 2
- relevant legal, ethical, social and professional considerations
- a complete and auditable GitHub/GitLab repository

In-Class Demonstrations

Each assessed sprint review will be conducted as a live in-class demonstration. The final Sprint 3 review will be the main final demonstration of the completed Task 1 work. No written report or recorded presentation is required.
All group members are expected to attend and participate. The module team may direct questions to individual students to establish understanding and contribution.
Students should be prepared to explain:

- stakeholder requirements and i* modelling decisions
- strategic and operational BPMN design decisions
- components, interfaces and services
- Camunda Forms and service tasks
- process variables and data handling
- automation and integration decisions
- alternative and exceptional process behaviour
- legal, ethical, social and professional implications
- how Task 1 work will be integrated into the Task 2 product

Submission and Repository Requirements
All assessed artefacts and evidence must be maintained in the group's GitHub or GitLab repository. The repository should provide a clear, auditable record of development throughout the sprints.
The repository must include, where applicable:

- i* Strategic Dependency and Strategic Rationale models
- strategic BPMN model
- operational BPMN models
- executable Camunda BPMN files
- Camunda Forms
- service-task and supporting source code

- project management evidence or links
- README/setup information where required to run the artefacts
- clear commit history showing development over time and individual contributions
- signed Contribution Matrix

The version available in the repository at the relevant sprint submission point will be used as the submitted evidence for that sprint. Students are responsible for ensuring that the repository is accessible to the module team.

Group Working

All group-working rules identified for Assessment Task 2 also apply to Assessment Task 1. Groups must contain 4-5 members, with a maximum group size of five. The same group will remain together for both assessment tasks and the full module project.

- maintain regular communication
- establish appropriate roles and responsibilities
- use version control consistently
- maintain an appropriate product backlog
- record individual contributions
- participate in sprint activities and demonstrations
- raise group-working problems with the module team as early as possible

If a member becomes unresponsive or does not participate appropriately, the group should retain evidence of attempts to engage the student and contact the module team promptly.

Contribution Matrix

A signed Contribution Matrix must be submitted through the group repository. The matrix must provide a genuine and accurate reflection of the work undertaken by each group member.
By signing the agreed Contribution Matrix, each member confirms that the contribution information provided is genuine and true. Where the submitted matrix does not reflect the actual contribution demonstrated through repository history, sprint participation, demonstrations or observations by the module team, the module team reserves the right to determine or amend individual contribution using academic judgement.
If a Contribution Matrix is not submitted, it will normally be considered that all members contributed equally. However, where the module team's observations or other available evidence indicate that contribution was not equal, individual contribution will be determined using the available evidence and academic judgement.
Any individual mark adjustment based on contribution will follow the group-work and contribution rules specified for Assessment Task 2.

What am I required to do on this assessment?
You should begin by:

1. Forming your group.
2. Creating and sharing the GitHub/GitLab repository.
3. Reviewing the complete case study.
4. Identifying the principal stakeholders and major business processes.
5. Developing the strategic BPMN model.
6. Identifying candidate major functionalities.
7. Agreeing the two major functionalities with the module team.
8. Developing the product backlog and beginning sprint work.

Where should I start?

To achieve a pass, the group should demonstrate:

- a reasonable strategic BPMN model
- identifiable and reasonably complete i* SD and SR models
- two agreed major operational business processes
- reasonable consistency between the i* and BPMN models
- executable implementations of the core process flows
- appropriate use of Camunda user tasks and Forms
- appropriate service-task implementation
- reasonable end-to-end automation and integration
- appropriate evidence of sprint-based development through GitHub/GitLab
- reasonable understanding of relevant legal, ethical, social and professional considerations
- effective participation in the in-class demonstrations

Individual students must also demonstrate reasonable understanding of the work undertaken by the group.

What do I need to do to pass?

Higher marks require a clear and well-justified progression from strategic analysis through to executable implementation, with strong traceability between stakeholder goals and dependencies, strategic processes, operational processes and automated functionality.
High-performing groups should demonstrate robust use of BPMN and Camunda, including Forms, service tasks, process data, gateways, events, external interactions, exception handling and effective integration.
The repository should provide professional evidence of iterative development and meaningful contributions.
Students should demonstrate strong individual understanding during the in-class demonstrations and Q&A.

How do I achieve high marks in this assessment?

The lectures, practical sessions and sprint activities in Term 1 directly support this assessment. Practical sessions will progressively support strategic business process modelling, i* modelling, operational BPMN, Camunda process automation, Forms, service tasks, integration, testing, and evaluation of legal, ethical, social and professional considerations. Formative feedback will be provided throughout the sprint activities.

How does the learning and teaching relate to the assessment?

The lectures, practical sessions and sprint activities in Term 1 directly support this assessment. Practical sessions will progressively support strategic business process modelling, i* modelling, operational BPMN, Camunda process automation, Forms, service tasks, integration, testing, and evaluation of legal, ethical, social and professional considerations. Formative feedback will be provided throughout the sprint activities.

What additional resources may help me complete this assessment?

- https://www.uwe.ac.uk/study/study-support/study-skills

- Writing - Reading and writing | UWE Bristol
- How to give a presentation
- Writing feedback - Writing | UWE Bristol
- Studiosity - Study support | UWE Bristol for quick feedback on your writing

What do I do if I am concerned about completing this assessment?
It is recommended that you review all of the relevant materials on Blackboard. You can also speak to your module leader for advice and guidance.
UWE Bristol offer a range of Assessment Support Options that you can explore through this link, and both Student Support Advisers and Wellbeing Support are available.
For further information, please see the Student study essentials.

How do I avoid an Assessment Offence on this module?

You must ensure that the work submitted and demonstrated by your group represents the work undertaken by members of that group.

- appropriately acknowledge external sources
- comply with the assessment requirements relating to Generative AI
- maintain clear version-control evidence
- ensure that each member's contribution is represented accurately
- avoid sharing implementation work with other groups
- ensure that submitted models, processes and code have not been copied from another group or previous assessment
- AI Generated models/diagrams will be considered as plagiarised artefact
- You are allowed to use generative AI in the code development provided that you are clearly outlining the usage and demonstrating the comprehension of the developed logic(s)

All group members should be able to explain the work they claim to have undertaken.

Outline the most common forms of AOs for this type of assessment and brief guidance on how to avoid this.
Refer to academic-conduct-policy-and-academic-misconduct-procedures

Marks and Feedback

Your assessment will be marked according to the following marking criteria.
You can use these to evaluate your own work before you submit.

1. In line with UWE Bristol's Assessment Content Limit Policy (formerly the Word Count Policy), word count includes all text, including (but not limited to): the main body of text (including headings), all citations (both in and out of brackets), text boxes, tables and graphs, figures and diagrams, quotes, lists.
2. UWE Bristol's Academic Conduct Policy and Academic Misconduct Procedures (Assessment Offence Policy) is available from the Academic Integrity webpages and requires that you submit work that is entirely your own and reflects your own learning, so it is important to:
    - Ensure you reference all sources used, using the UWE Harvard/OSCOLA system (amend as appropriate) and the guidance available on UWE's Study Skills referencing pages.
    - Refer to peer reviewed primary sources, rather than using AI or secondary sources
    - Avoid copying and pasting any work into this assessment, including your own previous assessments, work from other students or internet sources
    - Develop your own style, arguments and wording, so avoid copying sources and changing individual words but keeping, essentially, the same sentences and/or structures from other sources
    - Never give your work to others who may copy it
    - If an individual assessment, develop your own work and preparation, and do not allow anyone to make amends on your work (including proof-readers, who may highlight issues but not edit the work).

    When submitting your work, you will be required to confirm that the work is your own, and text-matching software and other methods are routinely used to check submissions against other submissions to the university and internet sources. Details of what constitutes plagiarism and how to avoid it can be found on UWE's Study Skills pages about avoiding plagiarism.

Marking Criteria

Individual Mark Adjustment

Although the sprint marking criteria generate a group project mark, each student will receive an individual mark for Assessment Task 1. The individual mark will be adjusted to reflect the student's actual contribution to the group's work, using the agreed and signed Contribution Matrix together with supporting evidence such as GitHub/GitLab activity, sprint participation, project artefacts and observations made by the module team. A student who has contributed less than other members of the group may therefore receive a lower individual mark than the group project mark. Where contributions are equal, students will normally receive the same adjusted project mark. The module team reserves the right to amend the stated contribution percentages using academic judgement where the submitted Contribution Matrix does not accurately reflect the evidence of individual contribution.

The separately assessed **individual stand-up component is not adjusted by the Contribution Matrix**.

How are individual marks calculated?

Although Assessment Task 1 is undertaken as a group project, each student will receive an individual mark based on their contribution to the group's work.

The final Task 1 mark consists of two components:

1. Individual Group Project Mark – 80%
2. Individual Stand-up Performance – 20%

1. Individual Group Project Mark – 80%

The group will first receive a **Group Project Mark** based on the three assessed sprint reviews:

Group Project Mark = (Sprint 1 × 0.20) + (Sprint 2 × 0.30) + (Sprint 3 × 0.50)

The Group Project Mark will then be adjusted for each student according to their individual contribution to the project.

Each group must submit a **signed Contribution Matrix** identifying the percentage contribution made by each group member.

The individual contribution should be supported by evidence including:

- GitHub/GitLab commit history;
- contribution to models, code, Camunda processes and other project artefacts;
- project management records;
- participation in sprint activities;
- performance during sprint demonstrations;
- evidence of work undertaken by the individual; and
- observations made by the module team.

Individual Contribution Scaling

The student with the highest agreed contribution within the group establishes the reference contribution.

Scaling Factor = Individual Contribution Percentage ÷ Highest Contribution Percentage in the Group

The student's Individual Group Project Mark is then calculated as:

Individual Group Project Mark = Group Project Mark × Scaling Factor

Example

Assume a group receives a **Group Project Mark of 70%**.

Student	Contribution	Scaling Factor	Individual Group Project Mark
Student A	30%	30 ÷ 30 = 1.00	70.00%
Student B	25%	25 ÷ 30 = 0.83	58.33%
Student C	25%	25 ÷ 30 = 0.83	58.33%
Student D	20%	20 ÷ 30 = 0.67	46.67%

Where all members have contributed equally, all students will receive a scaling factor of **1.00** and therefore receive the full Group Project Mark.

Contribution Matrix

The Contribution Matrix must provide a **genuine and accurate reflection of the work undertaken by each individual member of the group**.

By signing the agreed Contribution Matrix, each group member confirms that the information provided is genuine and accurately represents the contribution made by members of the group.

If the submitted Contribution Matrix does not reflect the actual contribution evidenced through the repository, sprint activities, demonstrations, project records or observations made by the module team, the module team reserves the right to **amend the individual contribution using academic judgement**.

If a Contribution Matrix is **not submitted**, it will normally be assumed that all members of the group contributed equally.

However, where the available evidence or observations made by the module team indicate that contributions were not equal, the module team will determine the individual contributions based on the available evidence and academic judgement.

2. Individual Stand-up Performance – 20%

Stand-up performance is assessed **individually** and is not affected by the Contribution Matrix.

There will be **9 scheduled stand-ups**, and each student's **best 6 stand-up scores** will be counted.

Individual Stand-up Mark = (Sum of highest 6 stand-up scores ÷ 30) × 100

Final Individual Task 1 Mark

The final individual mark for Assessment Task 1 is calculated as:

Final Individual Task 1 Mark = (Individual Group Project Mark × 0.80) + (Individual Stand-up Mark × 0.20)

Therefore:

- **80%** of Task 1 reflects the quality of the group project, adjusted according to the student's individual contribution; and
- **20%** reflects the student's individual performance during the assessed stand-ups

Marking Criteria - Sprint 1 Review

20% of the Task 1 Group Mark

Criteria	Fail (<40)	Pass (40-49)	2nd Class (50-69)	1st Class (70+)
Strategic BPMN Model - 50% **MO1**	Strategic model absent, substantially incomplete or largely incorrect. Major enterprise processes and interactions are not represented effectively. Little understanding of appropriate strategic abstraction is demonstrated.	Basic strategic BPMN produced showing the principal business processes and actors. The enterprise is broadly represented, although the model may contain omissions, modelling weaknesses or inappropriate levels of detail.	Well-structured strategic BPMN representing the major processes, organisational areas, responsibilities, interactions and external actors. Appropriate level of abstraction with good alignment to the case study.	Comprehensive and professionally constructed strategic BPMN providing a coherent enterprise-level representation. Processes, organisational responsibilities, external interactions and interfaces are modelled at an appropriate strategic abstraction with excellent justification.
Business Analysis, Functional Scope and Sprint Planning - 30% **MO1**	Little evidence of systematic analysis of the case study. Major processes or functionalities are not appropriately identified. Product backlog and sprint planning are absent or ineffective.	Basic analysis undertaken with some major business processes and candidate functionalities identified. Basic product backlog and task planning are evident.	Good analysis of the enterprise with appropriate identification of major processes and candidate functionalities. Clear product backlog, responsibilities and realistic sprint planning are demonstrated.	Excellent analysis translating the case study into a coherent functional scope. Major functionalities are clearly justified and decomposed into a comprehensive product backlog with professional sprint planning, responsibilities and priorities.
Sprint Progress, Version Control and Professional Practice - 20% **MO1**	Little evidence of coordinated group activity. Repository use is absent, minimal or does not provide meaningful evidence of development. Work cannot be adequately explained by the group.	Basic use of GitHub/GitLab with some evidence of group activity and development. Basic division of tasks and progress can be demonstrated.	Consistent use of version control showing meaningful development activity. Good evidence of task allocation, individual contributions, collaboration and progress during the sprint.	Professional and systematic use of version control throughout the sprint. Repository history provides clear evidence of iterative development, meaningful individual contributions, collaboration, review and effective project management.

Marking Criteria - Sprint 2 Review

30% of the Task 1 Group Mark

Criteria	Fail (<40)	Pass (40-49)	2nd Class (50-69)	1st Class (70+)
i* Strategic Dependency and Strategic Rationale Modelling - 30% **MO1, MO2**	SD and/or SR models are absent, substantially incomplete or incorrectly constructed. Major actors, goals, dependencies or rationale are missing. Little understanding of socio-technical modelling is demonstrated.	Basic SD and SR models are provided. Principal actors and some goals, tasks, resources and dependencies are identified, although the models may contain omissions or inconsistencies.	Clear and reasonably complete SD and SR models. Appropriate actors, goals, softgoals, tasks, resources and dependencies are identified. Good understanding of stakeholder relationships and actor rationale is demonstrated.	Comprehensive and well-constructed SD and SR models demonstrating excellent understanding of the socio-technical environment. Actor rationale, dependencies, goals and softgoals are modelled coherently and critically, including relevant tensions, competing goals and stakeholder expectations.
Operational BPMN Modelling - 35% **MO1, MO2**	Operational processes are absent, substantially incomplete or technically incorrect. The two selected functionalities do not represent meaningful end-to-end processes. Limited relationship with strategic or stakeholder models is demonstrated.	Two operational processes are identifiable and basic end-to-end flows are represented. Appropriate BPMN elements are used at a basic level, although there may be omissions, inconsistencies or limited process complexity.	Both operational processes are well developed and demonstrate appropriate use of pools/lanes, tasks, gateways, events, message flows and process interactions. Clear relationship with strategic and stakeholder requirements is demonstrated.	Comprehensive and professionally constructed operational models demonstrating sophisticated and appropriate use of BPMN. Alternative paths, exceptions, interactions and process boundaries are modelled effectively with excellent traceability to the strategic BPMN and i* models.
Initial Camunda Process Automation - 25% **MO1**	Little or no executable implementation. Processes cannot be deployed or meaningfully executed. User interaction and automated processing are largely absent.	Basic executable processes developed. Core process paths can be demonstrated with some user tasks, Camunda Forms and/or initial service-task implementation. Implementation may be incomplete or unreliable.	The majority of the planned process functionality can be executed successfully. Appropriate use of Camunda Forms, user tasks, service tasks, process variables, gateways and business logic is demonstrated.	Substantial executable functionality is demonstrated for both processes. Camunda capabilities are used effectively and appropriately, with well-designed Forms, automated tasks, process variables, business logic and process behaviour.
Sprint Progress, Traceability and Version-Control Evidence - 10% **MO1, MO2**	Limited evidence of meaningful progression from Sprint 1. Repository history provides insufficient evidence of development or individual contributions.	Basic progression from Sprint 1 is visible. GitHub/GitLab contains some evidence of development and contribution.	Clear iterative progression is demonstrated through the repository. Modelling, implementation and project-management evidence show good traceability and meaningful contributions from group members.	Excellent evidence of iterative development through GitHub/GitLab. Repository history clearly demonstrates refinement following Sprint 1, systematic development, traceability between models and implementation, and transparent individual contributions.

Marking Criteria - Sprint 3 Review (Final In-Class Demonstration)

50% of the Task 1 Group Mark

Criteria	Fail (<40)	Pass (40-49)	2nd Class (50-69)	1st Class (70+)
End-to-End Process Automation - 30% **MO1**	One or both major functionalities are substantially incomplete or cannot be executed end-to-end. Significant implementation problems prevent meaningful demonstration.	Core paths of both major functionalities can be demonstrated with basic end-to-end execution. Some functionality may remain incomplete or unreliable.	Both major functionalities execute successfully end-to-end. Processes demonstrate effective user interaction, automated processing, business logic, process variables, decisions and appropriate process behaviour.	Both functionalities are fully and robustly automated end-to-end. Implementation demonstrates excellent control of process behaviour, alternative routes, exceptions, automated interactions and realistic business scenarios.
Camunda Forms and Process Implementation - 15% **MO1**	Forms and supporting process implementation are absent, unsuccessful or poorly integrated into the workflow.	Functional Camunda Forms and supporting process implementation are present for the core workflow, although implementation may be basic or inconsistent.	Forms are appropriately designed and integrated with user tasks, process variables and business logic. Implementation operates reliably across the two functionalities.	Excellent and professional use of Camunda Forms and supporting process implementation. User interaction, process data and automated behaviour are integrated seamlessly across the workflow.
Service, Interface and Process Integration - 15% **MO1**	Service tasks, interfaces or integrations are absent, unsuccessful or poorly understood. Components operate largely in isolation.	Basic service tasks and interfaces are implemented. Some successful interaction between process components or supporting services is demonstrated.	Appropriate service tasks and interfaces are successfully implemented. Components and services interact reliably, with good understanding of service boundaries, communication and data exchange.	Services, interfaces and process components are integrated effectively and robustly. Excellent understanding of enterprise component boundaries, service interaction, data exchange, failure handling and integration principles is demonstrated.
Model Consistency and Task 2 Integration Readiness - 15% **MO1**	Significant inconsistencies exist between the i* models, strategic BPMN, operational BPMN and executable implementation. Components show little evidence of being reusable in Task 2.	Basic consistency exists between models and implementation. Core components could be carried forward into Task 2 with substantial refinement.	Good consistency and traceability from stakeholder models through strategic and operational BPMN to executable implementation. Components provide a credible foundation for Task 2.	Excellent end-to-end traceability from stakeholder goals through strategic and operational processes to executable implementation. Components are well structured, maintainable and clearly designed for extension and integration within the Task 2 product.
Legal, Ethical, Social and Professional Evaluation - 10% **MO2**	LESP issues are absent, inaccurate or unrelated to the developed system.	Basic relevant LESP considerations are identified, although discussion is mainly descriptive or generic.	Relevant LESP implications are clearly explained and related to specific actors, goals, processes, data, services or implementation decisions.	Critical and well-informed evaluation of relevant LESP implications. Issues are explicitly linked to stakeholder requirements, process models and implementation decisions, with clear consideration of their impact on system design and operation.
In-Class Demonstration, Technical Understanding and Q&A - 15% **MO1, MO2**	Demonstration is poorly organised or unsuccessful. Group members demonstrate insufficient understanding of the models or implementation.	Working functionality is demonstrated and group members show basic understanding. Responses to questions may contain gaps or inaccuracies.	Clear and professional demonstration. Group members provide good explanations of modelling and technical decisions and respond competently to questions.	Highly professional and coherent demonstration showing the complete progression from enterprise analysis to implementation. Group members demonstrate excellent technical and conceptual understanding, justify decisions critically and respond confidently and accurately to questions.

Overall Task 1 Sprint Weighting

Sprint	Weighting within Task 1
Sprint 1 - Strategic Process Analysis and Project Setup	**20%**
Sprint 2 - Socio-Technical and Operational Modelling with Initial Automation	**30%**
Sprint 3 - Final Implementation, Integration and In-Class Demonstration	**50%**

Individual Stand-up Performance – 20%

There will be 9 scheduled stand-ups during Assessment Task 1.
Each student's best 6 stand-up scores from the 9 scheduled stand-ups will be used to calculate their Individual Stand-up Mark.

Each stand-up is marked out of 5 marks.

Students should provide a concise individual update covering:

- work completed since the previous stand-up;
- work planned before the next stand-up;
- any impediments, dependencies or technical problems;
- evidence of their individual contribution; and
- understanding of how their work contributes to the current sprint and overall project.

The module team may ask follow-up questions to establish the student's understanding and contribution.

Stand-up Scoring Criteria

Score	Performance Descriptor
5 – Excellent	Attends and provides a clear, concise and detailed progress update. Demonstrates substantial progress, strong understanding of the work undertaken, clear next steps and proactive identification or resolution of impediments. Evidence of contribution is clearly supported by the project/repository activity.
4 – Good	Attends and provides a clear progress update covering completed work, planned work and relevant impediments. Demonstrates good understanding, preparation and engagement with the project.
3 – Satisfactory	Attends and provides an adequate update. Demonstrates some meaningful progress and reasonable understanding of the work undertaken and planned.
2 – Limited	Attends but provides an incomplete or weak progress update. Limited evidence of meaningful progress, preparation or understanding is demonstrated.
1 – Minimal	Attends but provides very little meaningful information or evidence of contribution. Demonstrates minimal engagement or understanding.
0 – Non-attendance / No Assessable Participation	Does not attend the scheduled
